

Case Study

We were approached by an educational establishment to install an extraction system for their Welding Teaching Department. In addition to this turnkey project we also installed a Fettling Table with a complimentary Extraction System to fit into the small floor space made available.

The stationary filter unit is able to remove smoke and cutting dusts through a two stage filtration process to protect students from harmful contaminants. The fettling table is also able to be unhooked to give open sided access where required, but also a partial enclosure when in normal operation.

The client was pleased with the turnkey operation which was completed during University holiday downtime.
